ALQURS ENERGY

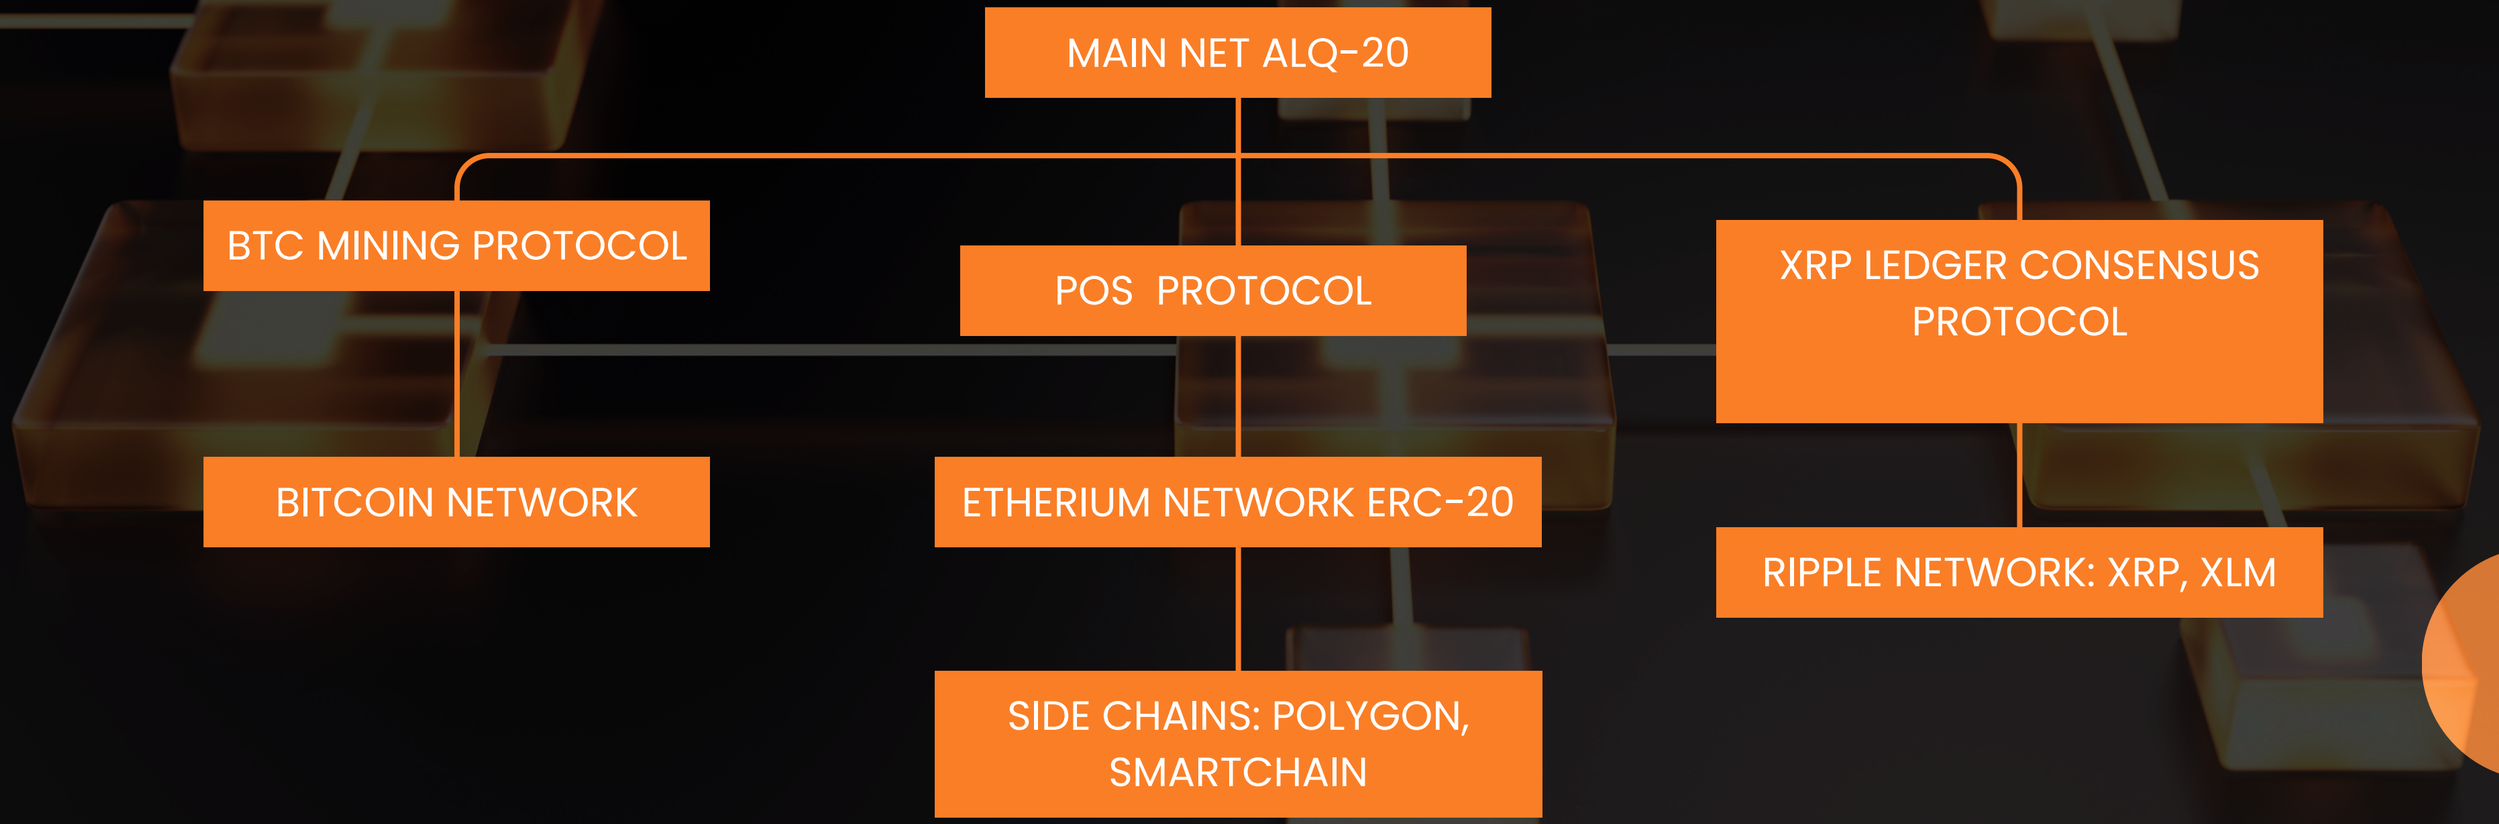
WELCOME TO THE FUTURE OF DECENTRALIZED ENERGY

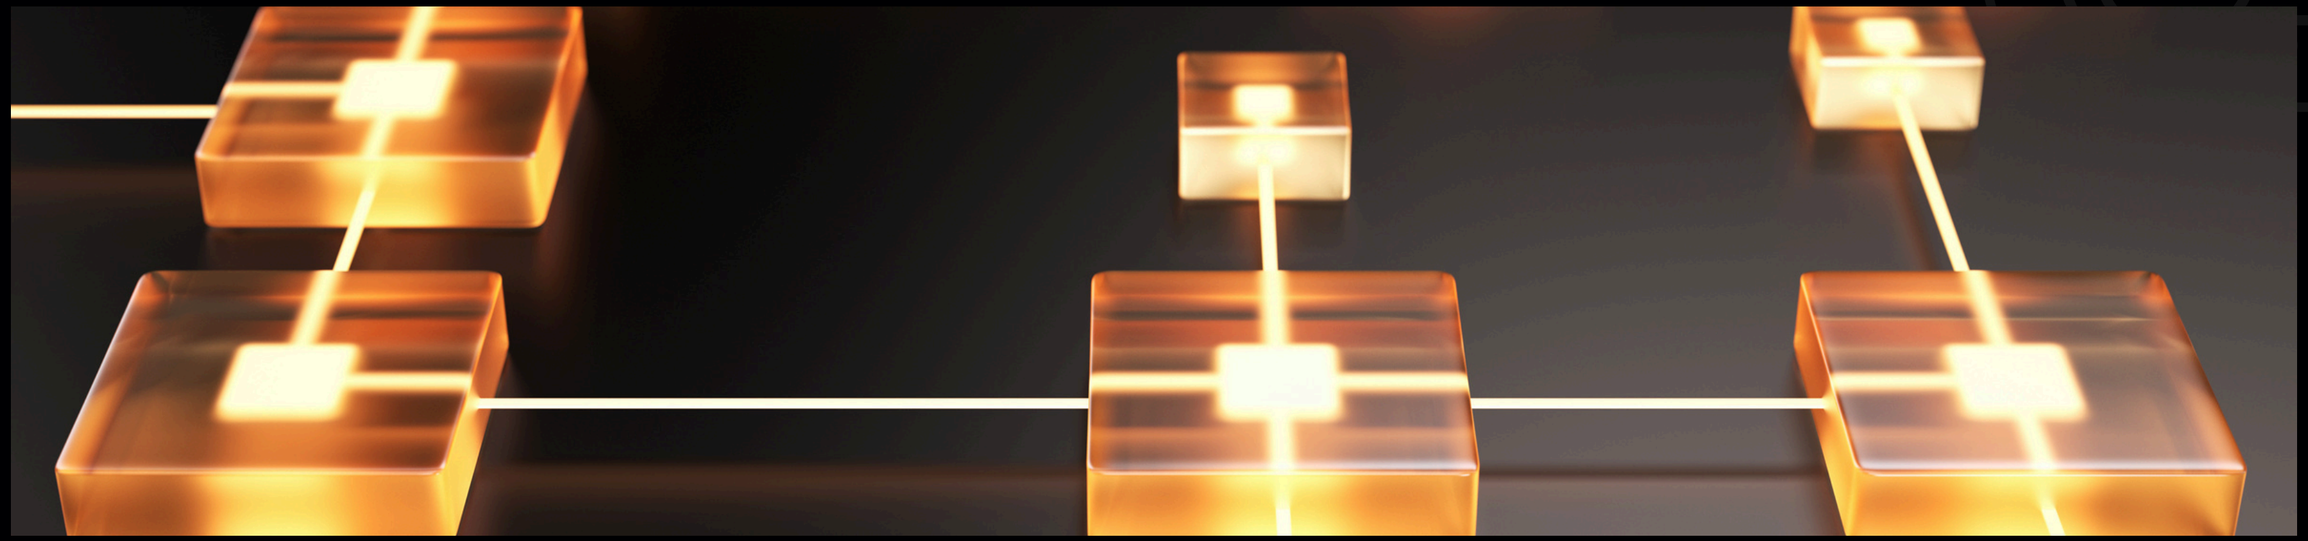
We are all aware of the potential that Bitcoin, Etherium and Ripple represent, each with their own unique features. However, until now, these networks have remained in isolation, which has held back their full potential.

We are proud to announce the launch of the ZION protocol, which connects Bitcoin, Etherium and Ripple into one single entity via the Alqurs network. This revolutionary update opens the door to new opportunities and collaboration between the largest cryptocurrencies and eco-friendly mining.

ALQURS ENERGY

STRUCTURE

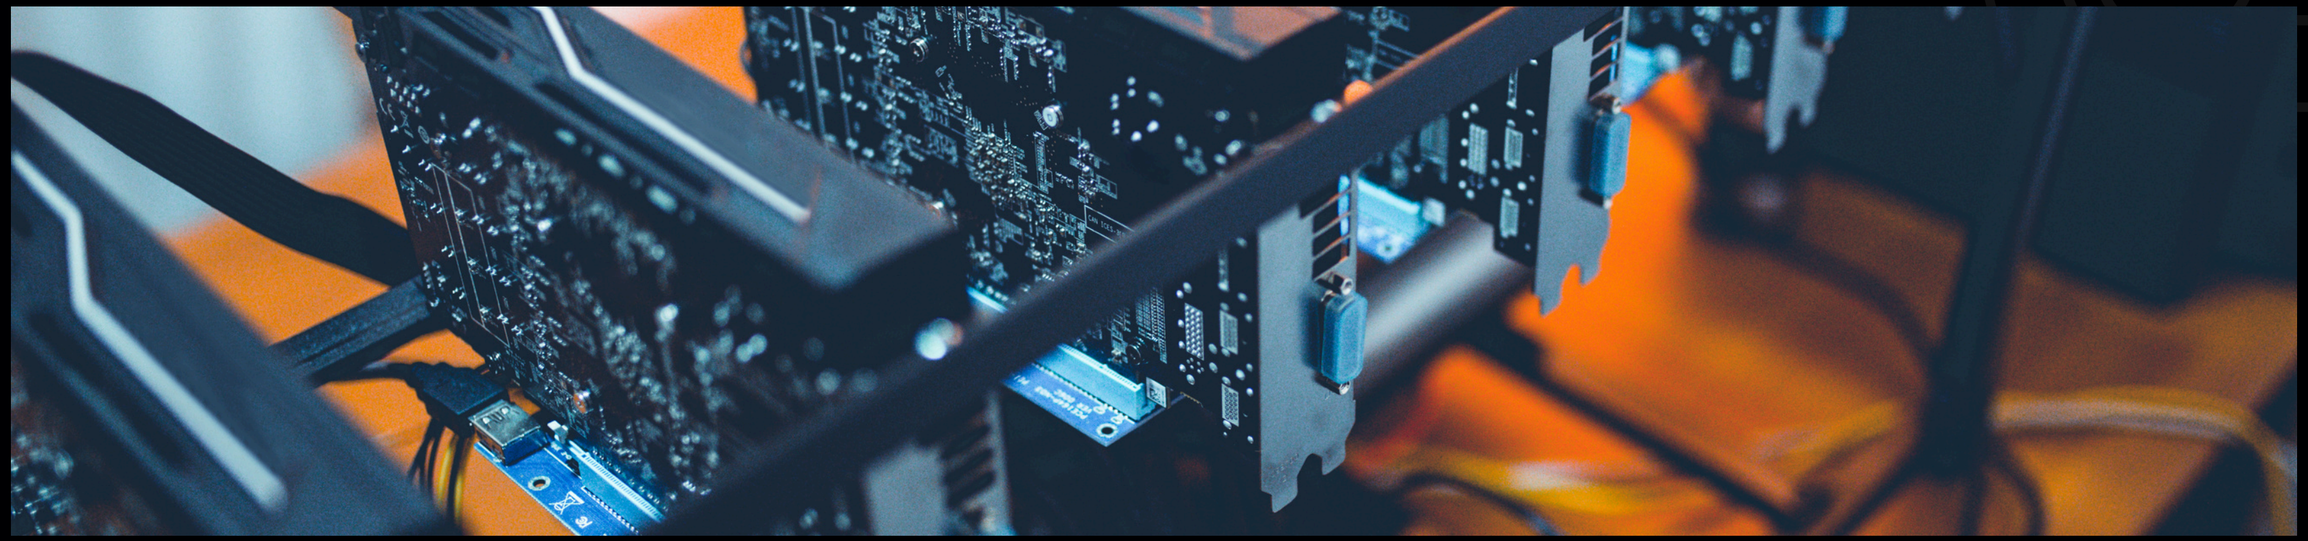




PROTOCOL GOALS

As each blockchain evolved in isolation, we faced a number of challenges that made mass integration with the Alqurs Network difficult. Limited scalability, expensive transactions and limited speed are just a few of the hurdles faced by isolated blockchains.

ALQURS ENERGY



Our update seeks to address these challenges by introducing the world to a blockchain that combines the power of the three largest cryptocurrency networks. We aim to create an environment where scalability, speed and accessibility become the standard.

The core of our update is the integration of protocols and consensus mechanisms. This allows us to create a universal environment where cryptocurrencies can exist and interact with the ALQ-20 mainnet.

ALQURS ENERGY

DEVELOPERS CHOOSE US

Scalability

The new architecture of our blockchain allows us to process many more transactions per second without compromising security and decentralisation.

Velocity

We have significantly increased the speed of transaction confirmation, making our blockchain even more attractive to a wide range of users.

Efficiency

New algorithms reduce energy costs and increase the efficiency of our network, making it more sustainable and powerful. Allowing us to increase the efficiency of "solar mining".

ALQURS ENERGY

KEY FEATURES

01

Decentralisation: We retain the decentralisation principle that underpins cryptocurrencies, while combining the power of the three largest networks

02

Compatibility and interoperability: The new blockchain enables interoperability between different Bitcoin, Etherium and Ripple-based assets and applications.

03

Cryptocurrency mining: Users can mine this network's cryptocurrency using various methods including mining, steaking and others.

04

Speed and Scalability: The Unified Protocol provides high transaction speed and scalability, making it an ideal choice for a variety of transaction types and data collections
